Water

Have you ever thought about the water you use every day? Water is valuable. It is valuable because everything needs water to survive, it is vital to human health, and only a little bit of the water on earth is fresh.

One reason why water is valuable is because everything needs water to survive. One example is that water keeps you hydrated. You need to keep yourself hydrated or you might get sick. Another example of why water is valuable is because it helps grow our food, both plant and animal. Without water we can't eat. Water is also a habitat for animals.

Another reason why water is valuable is because it is vital to human health. One example is that it helps keep you clean and prevents any infections. Another example is that it helps you cook and clean dishes. We wouldn't be able to make spaghetti if we didn't have clean water. Water cleans clothes. Without clean laundry, we would be sick.

The third reason why it is valuable is because only 2.5% of the world's water is fresh. Most of that water is trapped in glaciers. If we don't keep the fresh water that we have clean, we won't have water to drink. Another example is that if we keep on polluting the water we have, fish, turtles, and other animals won't have homes. The glaciers are starting to melt which means more of our freshwater is going to become salt water.

It's important that we think about the water that we use every day because we need to conserve the water we have so that **when times get tough we have enough.**
